What does a neuron compute?

- A neuron computes an activation function followed by a linear function (z = Wx + b)
- $\bigcirc$  A neuron computes a linear function (z = Wx + b) followed by an activation function

#### Correct

Correct, we generally say that the output of a neuron is a = g(Wx + b) where g is the activation function (sigmoid, tanh, ReLU, ...).

- A neuron computes the mean of all features before applying the output to an activation function
- A neuron computes a function g that scales the input x linearly (Wx + b)

Which of these is the "Logistic Loss"?

- $igcup \mathcal{L}^{(i)}(\hat{y}^{(i)},y^{(i)}) = \mid y^{(i)} \hat{y}^{(i)} \mid^2$
- $igcap \mathcal{L}^{(i)}(\hat{y}^{(i)},y^{(i)}) = \mid y^{(i)} \hat{y}^{(i)} \mid$
- $\mathcal{L}^{(i)}(\hat{y}^{(i)}, y^{(i)}) = -(y^{(i)}\log(\hat{y}^{(i)}) + (1-y^{(i)})\log(1-\hat{y}^{(i)})$

## Correct

Correct, this is the logistic loss you've seen in lecture!

 $igcap \mathcal{L}^{(i)}(\hat{y}^{(i)},y^{(i)}) = max(0,y^{(i)}-\hat{y}^{(i)})$ 

3. Suppose img is a (32,32,3) array, representing a 32x32 image with 3 color channels red, green and blue. How do you reshape this into a column vector?

x = img.reshape((1,32\*32,\*3))

x = img.reshape((32\*32\*3,1))

Correct

x = img.reshape((3,32\*32))

x = img.reshape((32\*32,3))

4.

Consider the two following random arrays "a" and "b":

```
1  a = np.random.randn(2, 3) # a.shape = (2, 3)
2  b = np.random.randn(2, 1) # b.shape = (2, 1)
3  c = a + b
```

What will be the shape of "c"?

c.shape = (2, 1)

c.shape = (3, 2)

The computation cannot happen because the sizes don't match. It's going to be "Error"!

c.shape = (2, 3)

# Correct

Yes! This is broadcasting. b (column vector) is copied 3 times so that it can be summed to each column of a.

1/1 points

5.

Consider the two following random arrays "a" and "b":

```
1 a = np.random.randn(4, 3) # a.shape = (4, 3)
2 b = np.random.randn(3, 2) # b.shape = (3, 2)
3 c = a*b
```

What will be the shape of "c"?

### Correct

Indeed! In numpy the "\*" operator indicates element-wise multiplication. It is different from "np.dot()". If you would try "c = np.dot(a,b)" you would get c.shape = (4, 2).

c.shape = (3, 3) c.shape = (4,2)

c.shape = (4, 3)

6.

Suppose you have  $n_x$  input features per example. Recall that  $X=[x^{(1)}x^{(2)}\dots x^{(m)}]$ . What is the dimension of X?

 $(m,n_x)$   $(n_x,m)$ 

Correct

- (m,1)

1/1 points

7.

Recall that "np.dot(a,b)" performs a matrix multiplication on a and b, whereas "a\*b" performs an element-wise multiplication.

Consider the two following random arrays "a" and "b":

```
1  a = np.random.randn(12288, 150) # a.shape = (12288, 150)
2  b = np.random.randn(150, 45) # b.shape = (150, 45)
3  c = np.dot(a,b)
```

What is the shape of c?

c.shape = (150,150)

### Correct

Correct, remember that a np.dot(a, b) has shape (number of rows of a, number of columns of b). The sizes match because :

"number of columns of a = 150 = number of rows of b"

The computation cannot happen because the sizes don't match. It's going to be "Error"!

8.

Consider the following code snippet:

```
1  # a.shape = (3,4)
2  # b.shape = (4,1)
3
4  for i in range(3):
5   for j in range(4):
6   c[i][j] = a[i][j] + b[j]
```

How do you vectorize this?

() c = a.T + b.T

C = a.T + b

c = a + b.T

Correct

c = a + b

9.

Consider the following code:

```
1    a = np.random.randn(3, 3)
2    b = np.random.randn(3, 1)
3    c = a*b
```

What will be c? (If you're not sure, feel free to run this in python to find out).

This will invoke broadcasting, so b is copied three times to become (3,3), and \* is an element-wise product so c.shape will be (3,3)

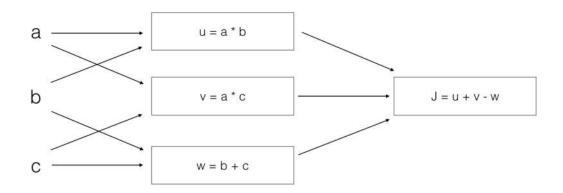

### Correct

- This will invoke broadcasting, so b is copied three times to become (3, 3), and \* invokes a matrix multiplication operation of two 3x3 matrices so c.shape will be (3, 3)
- This will multiply a 3x3 matrix a with a 3x1 vector, thus resulting in a 3x1 vector. That is, c.shape = (3,1).
- It will lead to an error since you cannot use "\*" to operate on these two matrices. You need to instead use np.dot(a,b)

**10.** Consider the following computation graph.

What is the output J?

$$J = (c - 1)*(b + a)$$

$$\int J = (a - 1) * (b + c)$$
